

# Episode One Hundred Forty-Six - "Epicurus And His Philosophy" Part 02 - The Three Divisions of Epicurean Philosophy

**Post by "Cassius" of October 31, 2022 at 2:06 AM**

Oh that last comment reminds me of one of my favorite subjects - outlining software. There is even a website dedicated to the topic: <http://www.outlinersoftware.com>

Those two outlines above were produced with the software that I have sworn by for 20+ years: Ecco Pro. If I make it to 90 years old and die at my computer I will probably be typing into my Ecco outlines at the moment I kick off. Unfortunately development of Ecco stopped long ago, and today probably the premier interactive outliners that feature easy expanding and collapsing include Logseq and Dynalist.

Of course the forum here itself has an outlining function, but no ability to expand and collapse ("fold"). Another example is the current outline for the LucretiusToday podcast we are using at the wiki page <https://epicuruscollege.com/wiki/lucretius...I series - eahp> That outline is generated by Dokuwiki and it works ok for "folding," but it doesn't have the ability to zoom to different levels (for example, to show only all first and second level headings) like full featured outlining software can do.

Repeating Kalosyni's original comment I think it would be a great project for anyone (and many people) to organize their Epicurean research and produce public "live" outlines that can be viewed at varying levels.

If I were to attack such a project at the moment I would probably use Dynalist, but if anyone has better suggestions please post in the thread. I know a lot of us are familiar with WordPress - maybe WordPress has an outliner plugin? Numbers of us have done blogs in the past but if we could figure out a way to publish live outlines that can be interactively zoomed at varying levels, that format would probably be at least as useful as the standard blog format organized by date.

If anyone is interested in working on such a project they should of course feel free to copy and paste the text of my existing outlines above into their own new formats for further development and revision.

In fact, the existing two outlines above are simple HTML, and anyone who is proficient in HTML can simply download the existing page (it's all a single HTML page) and modify it to make it much more attractive. I never learned real CSS skills so I was only able to make minimal changes to the format generated by EccoPro. Should be easy for someone with HTML/CSS skills to modify it. For example I see that as you drill down through the bullets the font sizes don't

seem to match. If anyone wants to spend time cleaning up the HTML in these versions I would gladly update the existing versions on this and the NewEpicurean websites. But I suspect it makes the most sense to take the text and rework it using an up-to-date static site generator.
