

# The True Scale of Atoms

Post by "Bryan" of December 24, 2023 at 1:05 AM

(excuse my slight swerve from the topic)

This is fun:

Quote from Relativity: The Special and General Theory, 1916, Translated: Robert W. Lawson

The purpose of mechanics is to describe how bodies change their position in space with "time." **I should load my conscience with grave sins against the sacred spirit of lucidity were I to formulate the aims of mechanics in this way**, without serious reflection and detailed explanations. Let us proceed to disclose these sins.

**It is not clear what is to be understood here by "position" and "space."** I stand at the

window of a railway carriage which is travelling uniformly, and drop a stone on the

embankment, without throwing it. Then, disregarding the influence of the air resistance, I see the stone descend in a straight line. A pedestrian who observes the misdeed from the footpath notices that the stone falls to earth in a parabolic curve. I now ask: Do the "positions" traversed by the stone lie "in reality" on a straight line or on a parabola?

Moreover, what is meant here by motion "in space" ? From the considerations of the

previous section the answer is self-evident. **In the first place we entirely shun the vague word "space," of which, we must honestly acknowledge, we cannot form the slightest conception**, and we replace it by "motion relative to a practically rigid body of reference."

The positions relative to the body of reference (railway carriage or embankment) have

already been defined in detail in the preceding section. If instead of " body of reference" we insert "system of co-ordinates," **which is a useful idea for mathematical description**, we are in a position to say : The stone traverses a straight line relative to a system of coordinates rigidly attached to the carriage, but relative to a system of co-ordinates rigidly attached to the ground (embankment) it describes a parabola. **With the aid of this example it is clearly seen that there is no such thing as an independently existing trajectory**, but only a trajectory

relative to a particular body of reference.

When it is put so simply, it is easy to simply disagree with it.

Ultimately, Einstein throws away the void, and his "vacuum" is affected by gravity.
