

# Maximum pleasure as absence of all pain: a philosophical question concerning neuroscientific and Epicurean outlook toward the feeling of pleasure

Post by "TauPhi" of January 20, 2024 at 6:24 AM

[Quote from shahabgh66](#)

Here is the argument: From a neuroscientific outlook, when brain produces any of these six hormones of Endorphins, Dopamine, Oxytocin, Norepinephrine, Cortisol and Adrenaline, one feels pleasure.

So if someone is in a state of total inactivity, and thinks about nothing pleasurable or troubling and feels no pain in his body, the reward system of the brain is not working\*. So it does not produce any hormones that create such effect which is generally known as pleasure.

I'm as much a biologist as I am a fridge but if none of the hormones and neurotransmitters are at work at any given time in one's body, wouldn't that be a strong indication that this individual is as alive as a dodo?
