Hmmmm I just read that full article and that last sentence which you quoted ("Summary: If a philosopher starts speaking about elementary particles, run.") seems almost a non sequitur to the rest of the article. Apparently she means the reader to understand that a philosopher would be talking about elemental particles only because they (the philosophers) were talking about the particles having thoughts? If so that surely does not apply to Epicurus and one begins to wonder just how much reading into Epicurus she has done - is it possible that the answer is "not much"?
