

# **Please, no dogmatism, no absolute truths**

**Post by “michelepinto” of April 1, 2019 at 1:26 AM**

In the scientific world everything is questioned, always.

Newton's laws on universal gravitation have been superseded by Einstein's Theory of Relativity, which in turn can be overcome by even broader laws.

In the same way I do not struggle to define "Truth" what Epicurus taught us and that we also experience every day. But I do not exclude that we can arrive at greater truths.

A good example could be the scientific studies done today on happiness with hundreds or thousands of volunteers and study methods not available at the time of Epicurus.

(The studies I know all confirm what Epicurus said).

On "Few days in Athen" you told me right away that I would like it. I bought the ebook, but I haven't read it yet.

When I say "I'll never find myself saying, I'm right, you're wrong" I mean before the discussion. Otherwise the debate would be useless, a dialogue between the deaf. Later, of course, I will draw my own conclusions.
