Trust women, since they know many things about GREAT PAINS (labor pains), and GREAT PLEASURES (breast feeding and the hugging of our babies), and as Elayne knows the important role of the Oxytocin in general :

**Oxytocin is a hormone and a neurotransmitter that is involved in childbirth and breast-feeding. It is also associated with empathy, trust, sexual activity, and relationship-building.**

**It is sometimes referred to as the "love hormone," because levels of oxytocin increase during hugging and orgasm. It may also have benefits as a treatment for a number of conditions, including depression, anxiety, and intestinal problems.**

**Oxytocin is produced in the hypothalamus, a part of the brain. Females usually have higher levels than males.** 😊

**Here are some key points about oxytocin. More detail is in this article :**

**Oxytocin is produced in the hypothalamus and released during sex, childbirth, and lactation to aid reproductive functions.**

**It has physical and psychological effects, including influencing social behavior and emotion.**

**Oxytocin is prescribed as a drug for obstetric and gynecological reasons and can help in childbirth.**

**Research shows that it may benefit people with an autistic spectrum disorder (ASD), anxiety, and [irritable bowel syndrome](#) (IBS).**
