Looking at previous editions, the sound quality is good enough that Google Translate in transcribe mode is able to do a pretty good job.

Which presumably means we won't get much out of watching "Live" but that shortly after it's published to youtube they will do a speech to text, and maybe have an English version of that?

Lately on Youtube I have noticed that some videos that I am sure were done in only english now have a foreign language audio option- Or at least an auto-generated text translation.

Is anyone following the technology here closely enough to clarify?

From what I can see from their youtube channel, even all their previous symposia are still without subtitles.

What I mean is, you can play the youtube video on one device (such as computer), while on another device (such as phone or tablet) run Google Translate set to "transcribe mode" to process continuous audio. Google Translate will hear the Greek being said live on the youtube video and output English translation captions.

Looks like you can even do it on the same device, using Google Translate web version. You select Greek as the input language and click the microphone to start listening. Then in another window you play the video. The web version appears to limit you to 5000 characters at a time, at which point you would have to refresh the page. Whereas in the phone or tablet app version of Google Translate, you can enter "transcribe mode" which should allow continuous transcription.
