II. Physics (in which I will include relevant biological research, which is ultimately physics)

This is a point that I've been thinking and reading about lately. I'm beginning to understand current biological research as part of the Canon (how we know things), and Physics as dealing perhaps more with non-biological (or non-cognitive?) processes.

I'm coming at this from a design background and with very limited scientific background. To this point I've primarily been reading work by Sarah Williams Goldhagen, an architectural critic interested in neuroscience and embodied cognition. As I approach these fields from an Epicurean viewpoint, it seems that modern biological science is addressing sensations, prolepseis and feelings as an integrated whole and validating and clarifying the Canon similarly to how modern physical science has been validating and clarifying the Physics.
